

# RestoreIT<sup>®</sup> LE

## PRODUCT OVERVIEW

RestoreIT LE is an easy-to-use data recovery utility that automatically backs up all files on a hard drive and tracks all changes thereafter. In case of a malware intrusion, an Operating System (OS) crash, a software installation gone wrong, or a problem caused by human error, RestoreIT LE lets a user quickly roll back a system to a point where it was working properly. Since it loads before the OS, RestoreIT will recover all files, even when the OS does not boot.

After installation, RestoreIT LE keeps an ongoing record of all sector-level changes and saves them as incremental backup points on a hidden and protected partition. RestoreIT LE can also save static snapshots (i.e. complete system image) in the same local partition, to an external storage device, or to a network device.

RestoreIT LE's proprietary technology makes data recovery quick, painless, and accurate.

- **Ease of Use:** The software has a simple, intuitive interface that even a novice can understand
- **Ongoing, Automatic Backup:** At the sector level of a hard drive, RestoreIT LE monitors all incremental changes to files. Users can easily set it to automatically back up an entire system every hour, every day, every week, or at other intervals
- **Total System Recovery:** Quickly restore the operating system of a computer damaged by an OS crash, malware intrusion, accidental file deletion, or software bug—even when the OS is not accessible
- **System Restore Scheduler:** Reset a system at pre-scheduled intervals to a user-defined configuration
- **Small Disk Space Requirement:** RestoreIT LE uses real-time, incremental backup technology and compresses its stored images, taking up only a small portion of total hard drive space

- **Unlimited Incremental Restore Points:** The number of restore points on a system is restricted only by the availability of disk space
- **Multiple Backup Options:** Back up a hard drive to a protected local partition, a USB device, a network storage device, or to CD / DVD
- **Password Protection:** Restrict user access to RestoreIT LE functionality; in both OS and Pre-OS modes

## TECHNICAL SPECIFICATIONS

RestoreIT LE resides between the system BIOS of a PC and its operating system. During installation, the software creates a hidden partition where it can save a complete (static) and partial (incremental) restore points. Users can select the size of their partition upon installation but a minimum default setting is approximately 10% of available hard drive space.

## HOW IT WORKS
